

# Male urinary incontinence

You are not alone; we can help you treat and manage urinary incontinence with the **Artificial Urinary Sphincter**.

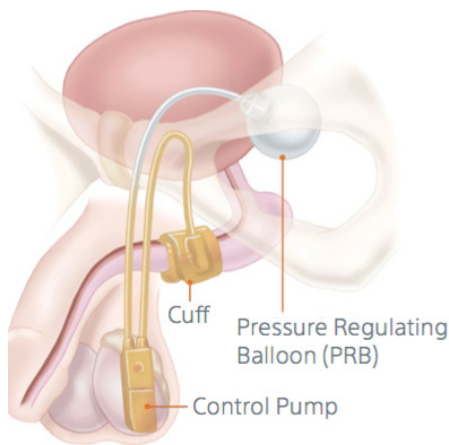

**Urinary incontinence (UI) is the loss of urine control and is fairly common and often treatable in men. There are many reasons why men become incontinent or have the inability to control their bladder. One such reason is the urinary sphincter, a muscle that controls the flow of urine and can be impacted due to stress.**

## **Artificial Urinary Sphincter is a less-invasive treatment option**

There is a method of significantly improving stress-induced incontinence, and our team can help by providing you with more information on the artificial urinary sphincter.

The **AMS 800 Artificial Urinary Sphincter**, a working mechanism, is a three-part urinary control system that is contained completely in the body.

- The control pump is implanted in the scrotum
- The inflatable cuff is placed around the urethra
- The saline-filled balloon is implanted in a natural open space next to the bladder

The Artificial Urinary Sphincter is placed inside the body, where the fluid filled cuff helps keep the urethra closed and a pump allows urination on demand.

Most men are given the ability to achieve continence after undergoing the AMS 800 Artificial Urinary Sphincter procedure and 90% of patients report long term-satisfaction and would undergo the procedure again.

**Our team is ready to work with you to determine the best treatment plan for your needs.**
